The project doesn't run because joi module was not found. You guys have a very strange project structure and you even do not include the package.json and instead you include package-lock.json ….. I cannot run the project …. Moving on .. The project routes are not close to being complete .. How about the forms guys ? The main goal of this project is generating one of 2 different company forms depending on the company type …. You copy pasted a lot … in lawyer the post request is in /joi ? really ? you blindly copy paste from ammar's lab sample code ? He only wrote /joi to distinuish between the routes where he is validating using joi …. I can see you don't follow a specific code guidelines, some routes you guys handle validations with joi others you don't handle anything and use the request body directly …. Ok, conclusion, you guys want to start following coding guidelines, your code is currently a mess, you need to stop copy pasting cause this would be considered cheating, if you want to copy paste you need to first understand how things work and then copy paste and adjust the code to fullfil your needs … The estimation report is clearly a joke … You guys need to work harder
